SAFETY PRECAUTION

Please read the following safety precautions carefully.

MARNING:

Precautions that must be observed to prevent injuries or death.

▲ CAUTION: Precautions that must be observed to prevent damage to unit.

This service manual along with the user manual should be left with the product after installation for future reference. Mitsubishi Electric is not responsible for the failure of locally-supplied parts.

- · Be sure to perform periodical maintenance.
- Be sure to follow your local regulations.
- Be sure to follow the instructions provided in this manual.

Mechanical

The hydrobox and outdoor units must not be installed, disassembled, relocated, altered or repaired by the user. Ask an authorised installer or technician. If the unit is installed improperly or modified after installation by the user water leakage, electric shock or fire may result. The outdoor unit should be securely fixed to a hard level surface capable of bearing its weight. The hydrobox should be positioned on a hard vertical surface capable of supporting its filled weight to prevent excessive sound or vibration. Do not position furniture or electrical appliances below the outdoor unit or hydrobox. The discharge pipework from the emergency/safety devices of the hydrobox should be installed according to local law. Only use accessories and replacement parts authorised by Mitsubishi Electric ask a qualified technician to fit the parts. Electrical All electrical work should be performed by a qualified technician according to local regulations and the instructions given in this manual. The units must be powered by a dedicated power supply and the correct voltage and circuit breakers must be used. Wiring should be in accordance with national wiring regulations. Connections must be made securely and without tension on the terminals. Earth unit correctly General Keep children and pets away from both the hydrobox and outdoor units. Do not use the hot water produced by the heat pump directly for drinking or cooking. This could cause illness to the user. Do not stand on the units Do not touch switches with wet hands. Annual maintenance checks on both the hydrobox and the outdoor unit should be conducted by a qualified person. Do not place containers with liquids on top of the hydrobox. If they leak or spill onto the hydrobox damage to the unit and/or fire could occur. Do not place any heavy items on top of the hydrobox When installing, relocating, or servicing the hydrobox, use only the specified refrigerant (R410A) to charge the refrigerant lines. Do not mix it with any other refrigerant and do not allow air to remain in the lines. If air is mixed with the refrigerant, then it can be the cause of abnormal high pressure in the refrigerant line, and may result in an explosion and other hazards. The use of any refrigerant other than that specified for the system will cause mechanical failure or system malfunction or unit breakdown. In the worst case, this could lead to a serious impediment to securing product safety. In heating mode, to avoid the heat emitters being damaged by excessively hot water, set the target flow temperature to a minimum of 2°C below the maximum allowable temperature of all the heat emitters. For Zone2, set the target flow temperature to a minimum of 5°C below the maximum allowable flow temperature of all the heat emitters in Zone2 circuit. Do not install the unit where combustible gases may leak, be produced, flow, or accumulate. If combustible gas accumulates around the unit, fire or explosion may result. Do not discharge refrigerant into the atmosphere if refrigerant leaks during installation, ventilate the room. Use appropriate tools for high pressure refrigerant. When pumping down refrigerant, stop the compressor before disconnecting the refrigerant pipes. During installation securely fasten the refrigerant pipes before starting the compressor. Check that refrigerant gas does not leak after the completion of installation Use R410A refrigerant only. Do not allow air to enter the lines. Failure to observe these instructions will cause mechanical failure, system failure or, in the worst case, serious breach of product safety.

Use clean water that meets local qual	ity standards on the primary circuit.					
The outdoor unit should be installed in	n an area with sufficient airflow accord	ing to the diagrams in the outdoor unit installation manual.				
The hydrobox should be located insid	e to minimise heat loss.					
Water pipe-runs on the primary circuit	between outdoor and indoor unit sho	uld be kept to a minimum to reduce heat loss.				
Ensure condensate from outdoor unit	is piped away from the base to avoid	puddles of water.				
Remove as much air as possible from						
Refrigerant leakage may cause suffor	cation. Provide ventilation in accordance	ce with EN378-1.				
Be sure to wrap insulation around the	piping. Direct contact with the bare pi	ping may result in burns or frostbite.				
Never put batteries in your mouth for	any reason to avoid accidental ingestion	on.				
Battery ingestion may cause choking	and/or poisoning.					
	prevent excessive sound or vibration d	uring operation.				
If power to the hydrobox is to be turned	ed off (or system switched off) for a lon	ig time, the water should be drained.				
Preventative measures should be tak ufacturer.	en against water hammer, such as ins	stalling a Water Hammer Arrestor on the primary water circuit, as directed by the man				
In order to prevent condensation on e	mitters, adjust flow temperature appro	priately and also set the lower limit of the flow temperature on site.				
<using heat="" pumps<="" r410a="" refrigerant="" td=""><td></td><td></td></using>						
	ants such as sulfuric compounds, oxida rigerant.	es, to connect the refrigerant pipes. Make sure the insides of the pipes are clean and ants, debris, or dust. Use pipes with the specified thickness. Note the following if reus				
	tallation indoors and keep both ends on the refrigerant lines, oil deterioration	of the pipes sealed until just before brazing. (Leave elbow joints, etc. in their packag or compressor breakdown may result.				
Use ester oil, ether oil, alkylbenzene rioration may result.	oil (small amount) as the refrigeration	oil applied to the flared sections. If mineral oil is mixed in the refrigeration oil, oil dete				
Do not use refrigerant other than R41	0A refrigerant. If another refrigerant is	used, the chlorine will cause the oil to deteriorate.				
, , , , , , , , , , , , , , , , , , ,		t. The following tools are necessary to use R410A refrigerant. Contact your neares				
Tools (fo	r R410A)					
Gauge manifold	Flare tool					
Charge hose	Size adjustment gauge					
Gas leak detector	Vacuum pump adapter					

Gas leak detector	Vacuum pump adapter	
Torque wrench	Electronic refrigerant charging scale	

Be sure to use the correct tools. If dust, debris, or moisture enters the refrigerant lines, refrigeration oil deterioration may result.

Do not use a charging cylinder, a cylindrical measuring container, when charging R410A refrigerant gas. If the refrigerant gas is transferred to a charging cylinder, the composition of the refrigerant will change and system efficiency will be reduced.

As for the handling of refrigerant, refer to the outdoor unit installation manual.

[1] Cautions for service

- (1) Perform service after recovering the refrigerant left in unit completely.
- (2) Do not release refrigerant in the air.
- (3) After completing service, charge the cycle with specified amount of refrigerant.
- (4) If moisture or foreign matter might have entered the refrigerant piping during service, ensure to remove them.

[2] Additional refrigerant charge

When charging directly from refrigerant cylinder

- (1) Check that cylinder for R410A on the market is syphon type.
- (2) Charging should be performed with the cylinder of syphon stood vertically. (Refrigerant is charged from liquid phase.)

[3] Service tools

Use the service tools below as exclusive tools for R410A refrigerant.

No.	Tool name	Specifications
		· Only for R410A
1	Gauge manifold	· Use the existing fitting specifications. (UNF1/2)
		\cdot Use high-tension side pressure of 5.3 MPa $\cdot G$ or over.
2	Charge have	· Only for R410A
2	Charge hose	· Use pressure performance of 5.09 MPa·G or over.
3	Electronic scale	—
4	Gas leak detector	· Use the detector for R134a, R407C or R410A
5	Adaptor for reverse flow check	· Attach on vacuum pump.
6	Refrigerant charge base	—
7	Defrigerent evlipder	· Only for R410A · Top of cylinder (Pink)
	Refrigerant cylinder	· Cylinder with syphon
8	Refrigerant recovery equipment	—

Do not connect to the terminals that are indicated as "-" in the "Terminal block" field

For 2-zone temperature control

*2. For 2-zone valve ON/OFF control.

6-7. DIP switch setting

Located on the FTC printed circuit board are 5 sets of small white switches known as DIP switches. The DIP switch number is printed on the circuit board next to the relevant switches. The word ON is printed on the circuit board and on the DIP switch block itself. To move the switch you will need to use a pin or the corner of a thin metal ruler or similar.

DIP switch settings are listed in the table below.

Only an authorised installer can change DIP switch setting under one's own responsibility according to the installation condition.

Make sure to turn off both indoor unit and outdoor unit power supplies before changing the switch settings.

	SW5-2	Advanced auto adaptation *8	Inactive	Active	OFF: Other than R1/R2 models
	SW5-3				OFF
	SW5-4			_	ON
		Capacity code	<u> </u>		ON
	SW5-6			_	OFF
	SW5-7				ON
	SW5-8				OFF

*1 When the hydrobox is connected with a outdoor unit of which maximum outlet water temperature is 55°C, DIP SW1-2 must be changed to OFF.

*2 OUT11 will be available. For safety reasons, this function is not available for certain errors. (In that case, system operation must be stopped and only the water circulation pump keeps running.) *3 This switch functions only when the hydrobox is connected with a PUHZ-FRP outdoor unit. When another type of outdoor unit is connected, the heating mode function is active regardless of the fact that this switch is ON or OFF. *4 Space heating and DHW can be operated only in indoor unit, like an electric boiler. (Refer to "Indoor unit only operation" in page 43.)

** Space nearing and Drive can be operated only in indoor unit, like an electric
 *5 If emergency mode is no longer required, return the switch to OFF position.
 *6 Active only when SW3-6 is set to OFF.
 *7 Active only when SW4-1 is set to ON.
 *8. SW5-2, "Advanced auto adaptation" is available for R1 and R2 models.

Automatic switch to heat source only operation

Back-up heat source operation (*1) will automatically run when the outdoor unit stops abnormally. To enable the function, switch DIP SW 2-5 to ON. During the back-up operation, an error code(s) and the contact number will be displayed alternately. External output (OUT11) will be available. To clear the fault(s), reset the power breakers on the indoor and outdoor units. <Applicable error codes (*2)>

E6 to E9, ED, P6, P8, U1 to U8, UD, UE, UF, UL, UP

(*1) Prolonged running of the back-up operation may affect the life of the heat source. (*2) For safety reasons, this function is not available for certain faults. (System operation must be stopped and only pump keeps running.)

FIELD WIRING

Breaker abbreviation	Meaning
ECB1	Earth leakage circuit breaker for booster heater
TB1	Terminal block 1

Option 1: Hydrobox powered via outdoor unit

<1 phase>

7

Affix label A that is included with the manuals near each wiring diagram for hydrobox and outdoor units.

*1 If the installed earth leakage circuit breaker does not have an over-current protection function, install a breaker with that function along the same power line.

<Figure 7-1> Electrical connections 1 phase

<3 phase>

Affix label A that is included with the manuals near each wiring diagram for hydrobox and outdoor units. Hydrobox

*1 If the installed earth leakage circuit breaker does not have an over-current protection function, install a breaker with that function along the same power line.

Description	Power supply	Capacity	Breaker	Wiring
Booster heater	3~ 400 V	9 kW	16 A *2	2.5
(Primary circuit)	50 Hz	9 6 7 7	10 A 2	mm²

<Figure 7-2> Electrical connections 3 phase

Wiring Viring No. size (mm²)	Hydrobox - Outdoor unit	*3	3 × 1.5 (polar)
Wir Wiring × size	Hydrobox - Outdoor unit earth	*3	1 × Min. 1.5
Circuit rating	Hydrobox - Outdoor unit S1 - S2	*4	230 V AC
Circ	Hydrobox - Outdoor unit S2 - S3	*4	24 V DC

*2 A breaker with at least 3.0 mm contact separation in each pole shall be provided. Use earth leakage breaker (NV). The breaker shall be provided to ensure disconnection of all active phase conductors of the supply.

*3 Maximum 45 m

If 2.5 mm² is used, maximum 50 m.

If 2.5 mm² is used and S3 is separated, maximum 80 m.

The values given in the table above are not always measured against the ground value.

Notes: 1. Wiring size must comply with the applicable local and national codes.

2. Indoor unit/outdoor unit connecting cords shall not be lighter than polychloroprene sheathed flexible cord. (Design 60245 IEC 57) Indoor unit power supply cords shall not be lighter than polychloroprene sheathed flexible cord. (Design 60227 IEC 53)

3. Install an earth longer than other cables.

4. Please keep enough output capacity of power supply for each heater. Insufficient power supply capacity might cause chattering.

Option2: Hydrobox powered by independent source

If the hydrobox and outdoor units have separate power supplies, the following requirements MUST be carried out:

- Change connector connections in hydrobox control and electrical box (see Figure 7-3). • Turn the outdoor unit DIP switch SW8-3 to ON.
- Turn on the outdoor unit BEFORE the hydrobox.
- · Power by independent source is not available for particular models of outdoor unit model.

For more detail, refer to the connecting outdoor unit installation manual.

<1 phase>

Affix label B that is included with the manuals near each wiring diagram for hydrobox and outdoor units.

Electrical connections 1 phase

<Figure 7-3>

*1 If the installed earth leakage circuit breaker does not have an over-current protection function, install a breaker with that function along the same power line.

<3 phase>

Affix label B that is included with the manuals near each wiring diagram for hydrobox and outdoor units.

*1 If the installed earth leakage circuit breaker does not have an over-current protection function, install a breaker with that function along the same power line.

Description	Power supply	Capacity	Breaker	Wiring

Circuit rating	Hydrobox - Outdoor unit S1 - S2	*4	—
02	Hydrobox - Outdoor unit S2 - S3	*4	24 V DC

A breaker with at least 3.0 mm contact separation in each pole shall be provided. Use earth leakage breaker (NV). The breaker shall be provided to ensure disconnection of all active phase conductors of the supply.

Maximum 120 m

*2

*3

*4

The values given in the table above are not always measured against the ground value.

Notes: 1. Wiring size must comply with the applicable local and national codes.

2. Indoor unit/outdoor unit connecting cords shall not be lighter than polychloroprene sheathed flexible cord. (Design 60245 IEC 57) Indoor unit power supply cords shall not be lighter than polychloroprene sheathed flexible cord. (Design 60227 IEC 53)

- 3. Install an earth longer than other cables.
- 4. Please keep enough output capacity of power supply for each heater. Insufficient power supply capacity might cause chattering.

20

Hydrobox

Water circuit diagram

8

*1 Refer to the following section [Local system].

<Figure 8-1>

Notes:

- Be sure to follow your local regulations to perform system configuration of the DHW connections.
- DHW connections are not included in the hydrobox package. All required parts are to be sourced locally.
- To enable draining of the hydrobox an isolating valve should be positioned on both the inlet and outlet pipework.
- Be sure to install a strainer on the inlet pipe work to the hydrobox.
- Suitable drain pipework should be attached to all relief valves in accordance with your country's regulations.
- A backflow prevention device must be installed on water supply pipework (IEC 61770).
- When using components made from different metals or connecting pipes made of different metals insulate the joints to prevent a corrosive reaction taking place which will damage the pipework.

OCH590C

Local system

- Optional part : PAC-TH011-E 9. Zone2 return water temp. thermistor (THW9) 1
- 18. Bypass valve (local supply) * Flow switch specifications: 12 V DC/1 mA / Both normally-open and normally-closed types can be used. (Set DIP switch 3 to select the logics. Refer to "6-7. DIP switch setting".)

OCH590C

22

Filling the System (Primary Circuit)

- 1. Check all connections including factory fitted ones are tight.
- 2. Insulate pipe work between hydrobox and outdoor unit.
- 3. Thoroughly clean and flush, system of all debris. (Refer to 4.2 in the installation manual.)
- 4. Fill primary heating circuit with water and suitable anti-freeze and inhibitor as necessary. Always use a filling loop with double check valve when filling the primary circuit to avoid back flow contamination of water supply.
- Anti-freeze should always be used for package systems. It is the responsibility of the installer to decide if anti-freeze solution should be used in split systems depending on each site's conditions. Corrosion inhibitor should be used in both split and package systems.
 Figure below shows freezing temperature against anti-freeze concentration. This figure is an example for FERNOX ALPHI-11. For other anti-freeze, please refer to relevant manual.
- When connecting metal pipes of different materials insulate the joints to prevent a corrosive reaction taking place which will damage the pipework.
- 5. Check for leaks. If leaks are found, retighten the screws on the connections.
- 6. Pressurise system to 1 bar.
- 7. Release all trapped air using air vents during and following heating period.
- 8. Top up with water as necessary. (If pressure falls below 1 bar)

Draining the Hydrobox

WARNING: DRAINED WATER MAY BE VERY HOT

- 1. Before attempting to drain the hydrobox isolate from the electrical supply to prevent booster heater burning out.
- 2. Isolate hydrobox from primary water circuit and drain water from hydrobox. Use a suitable heat resistant hose to assist in these operations.
- 3. Drain any remaining water from booster heater using fitted drain cock and hose, and the drain valve on the primary circuit to safely drain the unit.
- 4. After the hydrobox is drained, water remains in the following component parts. Drain water completely by checking the inside of the parts.
- Strainer (Remove the strainer cover.)
- Pressure relief valve (Operate the valve.)

CONTROLS

9-1. Main remote controller

9

<Main remote controller parts>

Letter	Name	Function
A	Screen	Screen in which all information is displayed
В	Menu	Access to system settings for initial set up and modifications.
С	Back	Return to previous menu.
D	Confirm	Used to select or save. (Enter key)
E	Power/Holiday	If system is switched OFF, pressing once will turn system ON. Pressing again when system is switched ON will enable Holiday Mode. Holding the button down for 3 seconds will turn the system OFF. (*1)
F1–4	Function keys	Used to scroll through menu and adjust settings. Function is determined by the menu screen visible on screen A.

*1 When the system is switched OFF or the power supply is disconnected, the hydrobox protection functions (e.g. freeze stat. function) will NOT operate. Please beware that without these safety functions enabled the hydrobox may potentially become exposed to damage.

*3 To lock or unlock the Menu, press the BACK and CONFIRM keys simultaneously for 3 seconds.

9-2. Setting the Main remote controller

After the power has been connected to the outdoor and hydrobox (See "7. FIELD WIRING") the initial system settings can be entered via the main remote controller.

- 1. Check all breakers and other safety devices are correctly installed and turn on power to the system.
- 2. When the main remote controller is switched on for the first time, the screen automatically goes to Initial settings menu, Language setting screen and Date/Time setting screen in order.
- 3. Main remote controller will automatically start up. Wait approximately 6 minutes whilst the control menus load.
- 4. When the controller is ready a blank screen with a line running across the top will be displayed.
- 5. Press button E (Power) (refer to page 24) to turn on the system. Before turning on the system, perform initial settings as instructed below.

9-3. Main Settings Menu

The main settings menu can be accessed by pressing the MENU button. To reduce the risk of untrained end users altering the settings accidentally, there are 2 access levels to the main settings; and the service section menu is password protected.

User Level - Short press

If the MENU button is pressed once for a short time, the main settings will be displayed but without the edit function. This will enable the user to view current settings but **NOT** change the parameters. The color of **◄** buttons is inverted as per right figure.

Installer Level - Long press

If the MENU button is pressed down for 3 seconds, the main settings will be displayed with all functionality available.

The following items can be viewed and/or edited (dependent on access level).

- Domestic Hot water (DHW)
- · Heating/Cooling
- Schedule timer
- Holiday mode
- Initial settings
 Convice (Decovered prot
- Service (Password protected)

General Operation

- To find the icon that you wish to set, use the F2 and F3 buttons to move between the icons.
- The highlighted icon will appear as a larger version of the center of the screen.
- Press CONFIRM to select and edit the highlighted mode.
- Follow the <Main Remote Controller Menu Tree> for further setting, using <> buttons for scrolling or F1 to F4 for selecting.

<Main remote controller Menu Tree>

9-4. Service Menu

The service menu provides functions for use by installer or service engineer. It is NOT intended the home owner alters settings within this menu. It is for this reason password protection is required to prevent unauthorised access to the service settings.

The factory default password is "0000".

Follow the procedure described in General Operation for the set up operation.

The service menu is navigated using the F1 and F2 buttons to scroll through the functions. The menu is split across 2 screens and is comprised of the following functions;

- 1. Manual operation
- 2. Function settings
- 3. Thermistor adjustment
- 4. Auxiliary settings
- 5. Heat source setting
- 6. Pump speed
- 7. Operation settings
- 8. Energy monitor settings
- 9. External input settings
- 10. Running information
- 11. Thermistor reading
- 12. Summary of settings
- 13. Error history
- 14. Password protection
- 15. Manual reset
- 16. SD card

Many functions cannot be set whilst the indoor unit is running. The installer should turn off the unit before trying to set these functions. If the installer attempts to change the settings whilst the unit is running the main remote controller will display a reminder message prompting the installer to stop operation before continuing. By selecting "Yes" the unit will cease operation.

<Manual operation>

During the filling of the system the water circulation pump and 3-way valve can be manually overridden using manual operation mode.

When manual operation is selected a small timer icon appears in the screen. The function selected will only remain in manual operation for a maximum of 2 hours. This is to prevent accidental permanent override of the FTC.

►Example

Pressing F3 button will switch manual operation mode ON for the main 3-way valve. When filling of the DHW tank is complete the installer should access this menu again and press F3 to deactivate manual operation of the part. Alternatively after 2 hours manual operation mode will no longer be active and FTC will resume control of the part.

Manual operation and heat source setting cannot be selected if the system is running. A screen will be displayed asking the installer to stop the system before these modes can be activated. The system automatically stops 2 hours after last operation.

<Function settings>

Function Setting allows the setting of auto recovery after power failure and of smart grid ready.

- 1. From the service menu use F1 and F2 to highlight Function Setting.
- 2. Press CONFIRM.
- 3. Ensure the Ref address and unit number are displayed to the right.
- 4. Press CONFIRM.
- 5. Use F3 and F4 to highlight either 1/2/3 (see below).
- 6. Press CONFIRM.

Setting	Unit	Mode	Number
Auto recovery after power failure	Grp	Mode1	1 - Inactive
			2 - Active *1
			3 - NO FUNCTION
Smart grid ready *2	1	Mode7	1 - Inactive
(Hot water operation)		*3	2 - Target temp. +3°C
			3 - Target temp. +5°C
Smart grid ready *2	1	Mode8	1 - Inactive
(Heating operation)		*3	2 - Thermo ON temp. +2°C
			3 - Thermo ON temp. +3°C

*1 Approx. 4-minute delay after power is restored.

*2 Refer to "Smart grid ready" in the indoor unit installation manual.

*3 If the mode is not displayed, Function Setting must be initialised. Enter Request code "200" in "Running Information".

Manual operation menu screen

<Thermistor adjustment>

This function allows adjustments to be made to the thermistor readings from -10 to 10°C in 0.5°C intervals.

THW1: Thermistor (Flow water temp.) THW2: Thermistor (Return water temp.) THW5: Thermistor (DHW tank water temp.)(Option) THW6: Thermistor (Zone1 flow temp.)(Option) THW7: Thermistor (Zone1 return temp.)(Option) THW8: Thermistor (Zone2 flow temp.)(Option) THW9: Thermistor (Zone2 return temp.)(Option) THWB1: Thermistor (Boiler flow temp.)(Option) THWB2: Thermistor (Boiler return temp.)(Option)

<Auxiliary settings>

This function is used to set the parameters for any auxiliary parts used in the system

	Delay	The minimum time required for the booster heater to turn ON			
		from after Heating mode has started.			
Electric he	ater (DHW)	To select "WITH (ON)" or "WITHOUT (OFF)" booster heater or			
		immersion heater individually in DHW mode.			
	Delay	The minimum time required for the booster heater or immersion			
		heater to turn ON from after DHW mode has started. (This			
		setting is applied for both booster and immersion heater.)			
Mixing	Running	Period from valve fully open (at a hot water mixing ratio of 100%)			
valve		to valve fully closed (at a cold water mixing ratio of 100%)			
control *2	Interval	Interval (min) to control the Mixing valve.			
Flow	Minimum	The minimum flow rate to be detected at Flow sensor.			
sensor *3	Maximum	The maximum flow rate to be detected at Flow sensor.			

*1 Decreasing "time before pump switched off" may increase the duration of stand-by in Heating/Cooling mode.

- *2 Set the Running time according to the specifications of the actuator of each mixing valve. It is recommended to set the interval to 2 minutes that is a default value. With the interval set longer, it could take longer to warm up a room.
- *3 Do not change the setting since it is set according to the specification of Flow sensor attached to the hydrobox.

Economy settings for pump

1. From the Auxiliary settings menu highlight Economy Settings for water circulation pump. 2. Press CONFIRM.

- 3. The economy settings for water circulation pump screen is displayed. 4. Use button F1 to switch the economy settings ON/OFF.
- 5. Use buttons F3 and F4 to adjust the time the water circulation pump will run. (3 to 60 minutes)

Electric heater (Heating)

- 1. From the Auxiliary setting menu highlight Electric heater (Heating).
- 2. Press CONFIRM.
- 3. The Electric heater (Heating) screen is displayed.
- 4. Press F1 button to switch the function ON/OFF.
- 5. Use F3 and F4 buttons to adjust the time period of heat pump only operation before the booster heater will assist in space heating. (5 to 180 minutes)

Electric heater (DHW)

- 1. From the Auxiliary settings menu highlight Electric heater (DHW).
- 2. Press CONFIRM.
- 3. The Electric heater (DHW) screen is displayed.
- 4. Press F1 button to switch the function ON/OFF.
- 5. Use F3 and F4 buttons to adjust the time period of heat pump only operation before the booster heater and the immersion heater (if present) will assist in DHW heating. (15 to 30 minutes)

Auxiliary settings menu screen

Electric heater (DHW) screen

Mixing valve control

- 1. From the Auxiliary settings menu highlight Mixing valve control.
- 2. Press CONFIRM.
- 3. The Mixing valve control screen is displayed.
- 4. Use F1 and F2 buttons to set Running time between 10 to 240 seconds. The Running time equals to a period from full open of the valve (at a hot water mixing ratio of 100%) to full close (at a cold water mixing ratio of 100%).

Note: Set the Running time according to the specifications of the actuator of each mixing valve.

- 1. From the Auxiliary settings menu highlight Mixing valve control.
- 2. Press CONFIRM
- 3. The Mixing valve control screen is displayed.
- 4. Press F3 and F4 buttons to set the interval between 2-zone temperature controls of the mixing valve between 1 to 30 minutes.
- Note: It is recommended to set the interval to 2 minutes that is a default value. With the interval set longer, it could take longer to warm up a room.

Flow sensor

- 1. From the Auxiliary settings menu highlight Flow sensor.
- 2. Press CONFIRM.
- 3. Press F3 or F4 buttons to select a refrigerant address of which you wish to configure or check the settings, and press CONFIRM.*1
- 4. The Flow sensor screen is displayed.
- 5. Use F1 and F2 buttons to set the minimum flow rate of flow sensor between 0 to maximum L/min.
- 6. Use F1 and F2 buttons to set the maximum flow rate of flow sensor between minimum to 100L/min.
- *1 For multiple outdoor units control system only.
- Note: Do not change the setting since it is set according to the specification of Flow sensor attached to the hydrobox.

Mixing valve setting screen

FLOW SENSOR	May 2015 12:30

_	-	-	

Pump speed setting screen

<Pump speed>

- 1. From the Service menu highlight water pump speed.
- 2. Press CONFIRM.
- Press F3 and F4 buttons to select a refrigerant address of which you wish to configure or check the settings, and press CONFIRM.*1
- 4. The Pump speed screen is displayed.
- 5. Use F2 and F3 buttons to set the pump speed of the water circulation pump between 1 and 5.
- *1 For multiple outdoor units control system only.

<Operation settings>

Heating operation

This function allows operational setting of flow temperature range from the Ecodan and also the time interval at which the FTC collects and processes data for the auto adaptation mode.

Menu subtitle		Function	Range	Unit	Default
Flow temp. range	Minimum temp.	To minimize the loss by frequent ON and OFF in mild outdoor ambient tem- perature seasons.		°C	30
	Maximum temp.	To set max. possible flow temperature according to the type of heat emitters.	35–60	°C	50
Room temp. control	Mode	Setting for Room temp. control At Fast mode, target outlet water temperature is set higher than the one set at normal mode. This reduces the time to reach the target room temperature when the room temperature is relatively low.*		_	Normal
	Interval	Selectable according to the heat emitter type and the materials of floor (i.e. radiators, floor heating-thick, -thin concrete, wood, etc.)	10–60	min	10
Heat pump thermo diff.adjust	ON/OFF	To minimize the loss by frequent ON and OFF in mild outdoor ambient tem- perature seasons.	ON/OFF	-	ON
	Lower limit	Prohibits heat pump operation until the flow temperature drops below the target flow temperature plus lower limit value.	-91	°C	-5
	Upper limit	Allows heat pump operation until the flow temperature rises above the target flow temperature plus upper limit value.	+3_+5	°C	+5

< Heating operation (Room temp. control table) >

Notes:

- 1. The minimum flow temperature that prohibits heat pump operation is 20°C.
- 2. The maximum flow temperature that allows heat pump operation equals to the maximum temperature set in the Flow temp. range menu.
- * Fast mode is not efficient and will increase running cost compared to normal mode.

Freeze stat function

Menu subtitle		Function/ Description
Freeze stat function *1		An operational function to prevent the water circuit from freezing when outdoor ambient temperature drops.
	Flow t.	The target outlet water temperature at water circuit when operating in Freeze stat function. *2
	Outdoor ambient temp.	Minimum outdoor ambient temperature which freeze stat function will begin to operate,
		(3–20°C) or choose**. If asterisk (**) is chosen freeze stat function is deactivated. (i.e. primary water freeze risk)"

*1 When the system is turned off, freeze stat function is not enabled.

*2 Flow t. is fixed to 20°C and unchangeable.

Simultaneous Operation

For periods of very low outside temperature this mode can be used. Simultaneous operation allows both DHW and space heating to run together by using the heat pump and/or booster heater to provide space heating whilst only the immersion heater provides heating for DHW. This operation is only available if BOTH a DHW tank AND immersion heater are present on the system.

- Range of outdoor ambient temperature at which simultaneous
- operation starts is −30 to 10°C (default −15°C).
- System shall automatically return to routine operation. This will happen when the outdoor ambient temperature rises above the
- selected temperature for this specific mode of operation.

Cold weather function

For extremely low outdoor ambient temperature conditions when the heat pump's capacity is restricted the heating or DHW is provided only by the electric booster heater (and immersion if present). This function is intended for use during extreme cold periods only. Extensive use of direct electrical heaters ONLY will result in higher power consumption and may reduce working life of heaters and related parts.

 $\ensuremath{\cdot}$ Range of outdoor ambient temperature at which cold weather function starts

- is −30 to −10°C (default −15°C).
- System shall automatically return to routine operation. This will happen when the outdoor ambient temperature rises above the selected temperature for this specific mode of operation.

Floor dry up function

The Floor dry up function automatically changes the target hot water temperature in stages to gradually dry concrete when this particular type of underfloor heating system is installed.

Upon completion of the operation, the system stops all the operations except the Freeze stat function operation.

For Floor dry up function, the target flow temp. of Zone1 is the same as that of Zone2.

Disconnect wiring to external inputs of room thermostat, demand control, and outdoor thermostat, or the target flow temperature may not be maintained.

Functions Floor dry up function		Symbol	Description	Option/Range	Unit	Default
		а	Sets the function to ON and power on the system using the main remote controller, and the dry up heating operation will start.	ON/OFF	-	OFF
Flow temp.	Flow temp. increase step	b	Sets the increase step of the target flow temperature.	+1_+10	°C	+5
(increase)	Increase interval	С	Sets the period for which the same target flow temperature is maintained.	1–7	day	2
Flow temp.	Flow temp. decrease step	d	Sets the decrease step of the target flow temperature.	-110	°C	-5
(decrease)	Decrease interval	e	Sets the period for which the same target flow temperature is maintained.	1–7	day	2
	Start & Finish	f	Sets the target flow temperature at the start and the finish of the operation.	25–60	°C	30
Target	Max. target temp.	g	Sets the maximum target flow temperature.	25–60	°C	45
temperature	Max. temp. period	h	Sets the period for which the maximum target flow temperature is main- tained.	1–20	day	5

<Energy monitor settings>

1. General description

End user can monitor accumulated(*1) 'Consumed electrical energy' and 'Delivered heat energy' in each operation mode(*2) on the main remote controller. *1 Monthlv and Year to date

- *2 DHW operation
- Space heating
- Space cooling

Refer to the menu tree in "9-3. Main Settings Menu" for how to check the energy, and "6-7. DIP switch setting" for the details on DIP-SW setting. Either one of the following 2 method is used for monitoring.

Note: The method (1) should be used as a guide. If a certain accuracy is required, the method (2) should be used.

(1) Calculation internally

Electricity consumption is calculated internally based on the energy consumption of outdoor unit, electric heater, water pump(s) and other auxiliaries. Delivered heat is calculated internally by multiplying delta T (Flow and Return temp.) and flow rate measured by the factory fitted sensors. Set the electric heater capacity and water pump(s) input according to indoor unit model and specs of additional pump(s) supplied locally. (Refer to the menu tree in "9-3. Main Settings Menu")

	Booster heater 1	Booster heater 2	Immersion heater * ²	Pump 1	Pump 2	Pump 3		
Default *1	2 kW	4 kW	0 kW	***	0 W	0 W		
ERSE-YM9EC	3 kW	6 kW	0 kW *2	*3				
ERSE-MEC	0 kW	0 kW	0 kW *2	*3	When additional pumps supplied local are connected as Pump2/3, change se			
EHSE-YM9EC	3 kW	6 kW	0 kW * ²	*3	according to specs of			
EHSE-MEC	0 kW	0 kW	0 kW *2	*3				

*1 Default setting is used for E*SC(D)/EHPX models. Please change setting according to the table above.

*² Change setting to 3 kW when connecting optional immersion heater "PAC-IH03V2-E".

*³ Please change setting according to the table below.

Pump speed	Pump 1	
Speed 5 (Default setting)	180 W	
Speed 4	172 W	
Speed 3	113 W	
Speed 2	70 W	
Speed 1	38 W	

When anti-freeze solution (propylene glycol) is used for primary water circuit, set the delivered energy adjustment if necessary. For further detail of above, refer to the menu tree in "9-3. Main Settings Menu".

(2) Actual measurement by external meter (locally supplied)

FTC has external input terminals for 2 'Electric energy meters' and a 'Heat meter'.

If two 'Electric energy meters' are connected, the 2 recorded values will be combined at the FTC and shown on the main remote controller.

(e.g. Meter 1 for H/P power line, Meter 2 for heater power line)

Refer to the [Signal inputs] in section "6. WIRING DIAGRAM" for more information on connectable electric energy meter and heat meter.

• Connectable electric energy meter and heat meter

- Pulse meter type
 Voltage free contact for 12 V DC detection by FTC (TBI.3 1, 3 and 5 pin have a positive voltage.)
- Pulse duration
 - Minimum OFF time: 100 ms

Possible unit of pulse
 0.1 pulse/kWh
 1 pulse/kWh
 10 pulse/kWh
 100 pulse/kWh

Minimum ON time: 40 ms

Those values can be set by the main remote controller. (Refer to the menu tree in "9-3. Main Settings Menu".)

2. Settings using the main remote controller

In this menu, all parameters required to record the consumed electrical energy and the delivered heat energy which is displayed on the main remote controller can be set. The parameters are an electric heater capacity, supply power of water pump and heat meter pulse.

Follow the procedure described in General Operation for the set up operation.

For Pump 1, *** can be also set besides this setting.

In the case *** is selected, the system acknowledges "factory fitted pump" is selected.

Energy monitor settings menu screen

32

<External input settings>

Demand control(IN4)

The selection of "OFF", whilst a signal is being sent to IN4, forcefully stops all the heat source operations and the selection of "Boiler" stops operations of heat pump and electric heater and performs boiler operation.

Outdoor thermostat (IN5)

The selection of "Heater", whilst a signal is being sent to IN5, performs electric-heater-only operation and the selection of "Boiler" performs boiler operation.

Demand control screen

Outdoor thermostat setting screen

<Running information>

This function shows current temperature and other data of main component parts of both the indoor and outdoor units.

- 1. From the Service menu highlight Running information.
- 2. Press CONFIRM.
- 3. Press F3 and F4 buttons to set the Ref. address. $^{\ast 1}$
- 4. Use the function buttons to enter index code for the component to be viewed.
- (See the Table 9-4-1 for component index codes.)
- 5. Press CONFIRM.
- *1 For multiple outdoor units control system only.

<Thermistor reading>

This function shows the current readings of thermistors located on the water and refrigerant circuit.

Thermistor	Description	Thermistor Description		
TH1A	Zone1 room temperature	THW6	Zone1 flow water temperature

<Error history>

Error history allows the service engineer to view previous Error codes, the unit address and the date on which they occurred. Up to 16 Error codes can be stored in the history the most recent Error event is displayed at the top of the list.

- 1. From the service menu select Error history
- 2. Press CONFIRM.
- Please see "10-4. Self diagnosis and action" for error code diagnosis and actions.

To delete an Error history item;

1. From Error history screen press F4 button (Rubbish bin icon).

2. Then press F3 button (Yes).

<Password protection>

Password protection is available to prevent unauthorised access to the service menu by untrained persons.

- 1. From the service menu use F1 and F2 buttons to scroll through list until Password protection is highlighted.
- 2. Press CONFIRM.
- 3. When password input screen is displayed use buttons F1 and F2 to move left and right between the 4 digits, F3 to lower the selected digit by 1, and F4 to increase the selected digit by 1.
- 4. When you have input your password press CONFIRM.
- 5. The password verify screen is displayed.
- 6. To verify your new password press button F3.
- 7. Your password is now set and the completion screen is displayed.

Resetting the password

If you forget the password you entered, or have to service a unit somebody else installed, you can reset the password to the factory default of **0000**.

- 1. From the main settings menu scroll down the functions until Service Menu is highlighted.
- 2. Press CONFIRM.
- 3. You will be prompted to enter a password.
- 4. Hold down buttons F3 and F4 together for 3 seconds.
- 5. You will be asked if you wish to continue and reset the password to default
- setting. 6. To reset press button F3.
- 7. The password is now reset to **0000**.

<Manual reset>

Should you wish to restore the factory settings at any time you should use the manual reset function. Please note this will reset ALL functions to the initial settings.

- 1. From the service menu use F1 and F2 buttons to scroll through list until Manual Reset is highlighted.
- 2. Press CONFIRM.
- 3. The Manual reset screen is displayed.
- 4. Choose either Manual Reset for FTC or Main Remote Controller.
- 5. Press F3 button to confirm manual reset of chosen device.

<u>1 May 2015 12:30</u> PASSWORD PROTECTION Password initialization <u>CONFIRMED!</u> 0000

Completion screen

No Yes

<SD card>

The use of an SD memory card simplifies the main remote controller settings in the field. Note: Ecodan service tool (for use with PC tool) is necessary for the setting.

$\underline{SD} \xrightarrow{\rightarrow} \underline{Main \ RC}$

- 1. From the SD card setting use F1 and F2 buttons to scroll through list until "SD \rightarrow Main RC" is highlighted.
- 2. Press CONFIRM.
- 3. Press F3 and F4 buttons to set the Ref. address. *1
- 4. Use F1, F2 and F3 buttons to select a menu to write to the main remote controller.
- 5. Press CONFIRM to start downloading.
- 6. Wait for a few minutes until "Complete!" appears.
- *¹ For multiple outdoor units control system only.

$\underline{\text{Main RC}} \xrightarrow{\rightarrow} \underline{\text{SD}}$

- 1. From the SD card setting use F1 and F2 buttons to scroll through list until Main RC \rightarrow SD is highlighted.
- 2. Press CONFIRM.
- 3. Press F3 and F4 buttons to set the Ref. address. *1
- 4. Use F1, F2 and F3 buttons to select a menu to write to the SD memory card.
- 5. Press CONFIRM to start uploading.
- 6. Wait for a few minutes until "Complete!" appears.
- *1 For multiple outdoor units control system only.

509			

Notes:

Refer to outdoor unit service manual for request code 0 to 102, 106 to 149.

Request codes 103 to 105 indicate error histories of both indoor and outdoor units.

As only 4 digits can be displayed at one time the software version number is displayed in two halves.

Enter code 190 to see the first 4 digits and code 191 to see the last 4 digits.

For example software version No. 5.01 A000, when code 190 is entered 0501 is displayed, when code 191 is entered A000 is displayed. Request code 200 resets all Function Setting to the factory default settings.

Indoor unit switch setting display (Request code: 162 to 166)

Indoor unit only operation

In indoor unit only operation, an operation without connecting outdoor unit is possible. When in Indoor unit only operation the main control has control functions.

<Heater>

Heating for DHW and space heating is provided by the heater.

- Activating indoor unit only operation mode
- To activate indoor unit only operation see the following:
- 1. Switch OFF the breaker for the outdoor unit (or both breakers if cylinder powered independently).
- 2. Change DIP switch SW4-4 and SW4-5 to ON.
- 3. Switch ON the breaker(s).
- 4. Indoor unit only operation is now activated.

Deactivating indoor unit only operation mode

- To deactivate indoor unit only operation see the following:
- 1. Switch OFF the breaker for the outdoor unit (or both breakers if cylinder powered independently).
- 2. Change DIP switch SW4-4 and SW4-5 to OFF.
- 3. Switch ON the breaker(s).
- 4. Indoor unit only operation is now deactivated.

<Boiler>

Heating for space heating is provided by the boiler.

- · Activating indoor unit only operation mode
- To activate indoor unit only operation see the following:
- 1. Switch OFF the breaker for the outdoor unit (or both breakers if cylinder powered independently).
- 2. Change DIP switch SW4-4 and SW4-6 to ON.
- 3. Switch ON the breaker(s).
- 4. Indoor unit only operation is now activated.

· Deactivating indoor unit only operation mode

- To deactivate indoor unit only operation see the following:
- 1. Switch OFF the breaker for the outdoor unit (or both breakers if cylinder powered independently).
- 2. Change DIP switch SW4-4 and SW4-6 to OFF.
- 3. Switch ON the breaker(s).
- 4. Indoor unit only operation is now deactivated.

Emergency operation

In emergency operation, an operation without connecting outdoor unit and main remote controller is possible.

When in Emergency operation the main control has NO control functions. Space heating flow temp. is restarted 40°C and DHW tank temp. is restricted 50°C. *1

<Heater>

Heating for DHW and space heating is provided by the heater.

- Activating emergency operation mode
- To activate emergency operation see the following:
- 1. Switch OFF the breaker for the outdoor unit (or both breakers if cylinder powered independently).
- 2. Change DIP switch SW4-5 to ON.
- 3. Switch ON the breaker(s).
- 4. Emergency operation is now activated.
- Deactivating emergency operation mode
- To deactivate emergency operation see the following:
- 1. Switch OFF the breaker for the outdoor unit (or both breakers if cylinder powered independently).
- 2. Change DIP switch SW4-5 to OFF.
- 3. Switch ON the breaker(s).
- 4. Emergency operation is now deactivated.

<Boiler>

Heating for space heating is provided by the boiler.

Activating emergency operation mode

To activate emergency operation see the following:

- 1. Switch OFF the breaker for the outdoor unit (or both breakers if cylinder powered independently).
- 2. Change DIP switch SW4-6 to ON.
- 3. Switch ON the breaker(s).
- 4. Emergency operation is now activated.

· Deactivating emergency operation mode

- To deactivate emergency operation see the following:
- 1. Switch OFF the breaker for the outdoor unit (or both breakers if cylinder powered independently).
- 2. Change DIP switch SW4-6 to OFF.
- 3. Switch ON the breaker(s).
- 4. Emergency operation is now deactivated.

Do not attempt to change the DIP switches whilst the breaker(s) are ON as this could result in ELECTROCUTION.

	Indoor unit only operation
Indoor unit	Necessary
Heat pump	Not necessary
Main remote controller	Necessary
DIP switch setting	Electric heater
	SW4-4 ON, SW4-5 ON
	Boiler
	SW4-4 ON, SW4-6 ON
Setting range for flow temp.	25-60°C Selectable
Setting range for tank temp.	40-60°C Selectable

	Emergency operation
Indoor unit	Necessary
Heat pump	Not necessary
Main remote controller	Not necessary
DIP switch setting	Electric heater SW4-5 ON
	Boiler SW4-6 ON
Setting range for flow temp.	Fixed at 40°C
Setting range for tank temp.	Fixed at 50°C *1
	Heat pump Main remote controller DIP switch setting Setting range for flow temp.

*1 Default setting is 50°C. Once system has started running, emergency operation runs at the latest set temp.

10-1. Troubleshooting

<Summary of self diagnosis based on Error Codes and Service Procedures>

Present and past Error codes are logged and displayed on the main remote controller or control board of the outdoor unit.

Please refer to the table below and subsequent explanations to diagnose and remedy typical problems that may occur in the field.

Unit Condition	Error Code	Action
Reoccurring problem	Displayed	Use table "10-4. Self diagnosis and action" to identify fault and correct.
	Not Displayed	Use table "10-5. Troubleshooting by inferior phenomena" to identify fault and correct.
Non reoccurring problem	Logged	 Check temporary causes of defects such as the operation of safety devices on the refrigerant/water circuit including compressor, poor wiring, electrical noise, etc. Re-check the symptom and the installation environment, refrigerant amount (Split systems only), weather conditions at time of fault, etc. Reset Error code logs, Service the unit and restart system.
	Not Logged	1. Recheck the abnormal symptom
		 Identify cause of problem and take corrective action according to Table "10-5. Trouble shooting by inferior phenomena".
		3. If no obvious problem can be found, continue to operate the unit.

NOTE:

Electrical components should only be replaced as a final option. Please follow instructions in tables in "10-4. Self diagnosis and action" and "10-5. Troubleshooting by inferior phenomena" fully before resorting to replacing parts.

10-2. Test Run

Before a test run

- After installation of outdoor unit, pipework and electrical wiring, recheck that there is no water leakage, loosened connections or miswiring.
- Measure impedance between the ground and the power supply terminal block (L,N) on the outdoor and indoor units with suitable (500V) ohmmeter. Resistance should be \geq 1.0 M Ω .
- Read the Installation and Operation Manuals fully especially the safety requirements before carrying out any test runs.

10-3. Malfunction diagnosis method by main remote controller

If during start up or operation a malfunction occurs, the error code screen may be displayed on the main remote controller. The error code screen shows the following; code, unit, ref. address, and telephone number of installer (only if previously entered by the installer) Please note in the case of some malfunctions an error code is not generated, please refer to table in "10-5. Troubleshooting by inferior phenomena" for more details.

To reset

- 1. To reset the main remote controller press F4 button (Reset).
- 2. Then press F3 (Yes) to confirm.

	seconds.	Leakage of water	
		2. Low temperature	
		Low load	
		 Inlet water is cold 	
		3. Defective water pump	3. Check water pump.
		4. Leakage or shortage of refrigerant	4. Correct to proper amount of refrigerant.
E0/E4	Main remote controller communication failure	 Malfunction of linear expansion valve Contact failure with transmission cable 	 Check linear expansion valve. Check connection cable for damage or
	(Reception error) Error code E0 is displayed if main remote control- ler does not receive any signal from the indoor unit for ref. address "0" for 3 minutes. Error code E4 is displayed if indoor unit does not receive any data from the main remote control- ler for 3 minutes or indoor unit does not receive any signal from the main remote controller for 2 minutes.	 Wiring procedure not observed (Cable length/cable diameter/number of indoor units/number of main remote controllers) Fault on the indoor unit FTC board section controlling Ref. address "0" Fault with the main remote controller circuit board Electrical noise causes interference with transmission/reception of data for main remote controller. 	 loose connections at the FTC and main remote controller terminals. 2. Check main remote controller and FTC common wiring max cable length 500 m. Only use 2 core cable. Only connect 1 main remote controller to 1 FTC indoor unit board. 3. to 5. If the problem is not solved by the above measures then: Turn the power to the indoor unit OFF and then ON. Power to both the indoor unit and outdoor units should be switched OFF then ON. (Thi may require switching 1 or 2 breakers depending if the unit is powered independent from the outdoor unit). If the E4 code is still displayed the FTC and or the main remote controller circuit board aboved be replaced
E3/E5	Main remote controller communication failure (Transmission error) Error code E3 is displayed if the main remote controller can not find an empty transmission path and thus fails to transmit for 6 seconds or the data received by the main remote controller is different to what was sent (by the main remote controller) 30 consecutive times. Error code E5 is displayed if the FTC cannot find an empty transmission path for 3 minutes and thus cannot transmit or the data sent by the FTC is different to what was expected 30 consecutive	 2 or more main remote controllers have been connected to the FTC. Fault with main remote controller transmission/receiving circuit board Fault with the main remote controller circuit board Electrical noise causes interference with transmission/reception of data for main remote controller. 	 Should be replaced. Only connect 1 main remote controller to 1 FTC indoor unit board. to 4. Turn the power to the indoor unit OFF and then ON. Power to both the indoor unit and outdoor units should be switched OFF then ON. (This may require switching 1 or 2 breakers depending if the unit is powered indepen- dently from the outdoor unit). If the E3/E5 code is still displayed the FTC and/or the main remote controller circuit board should be replaced.
E6	times. Indoor/outdoor communication failure (Reception error) Error code E6 is displayed if after the power is switched ON to the indoor unit, the FTC board does not receive any signal or the signal received is not complete for 6 minutes, or after a period of operation the FTC board does not receive any signal or the signal received is not complete for 3 minutes.	 Contact failure/short circuit/miswiring Fault with outdoor unit transmission/ receiving circuit board Fault with FTC transmission/receiving circuit board Electrical noise causes interference with FTC-Outdoor unit transmission cable. 	 Note: Check the LED display on the outdoor unit circuit board. (Connect the A-control service tool, PAC-SK52ST to test.) Refer to the outdoor unit service manual for explanation of EA-EC codes. Check the connections on the indoor and outdoor units have not become loose and that the connecting cable is not damaged. to 4. Turn the power to the indoor unit OFF and then ON. Power to both the indoor unit and outdoor units should be switched OFF then ON. (This may require switching 1 or 2 breakers depending if the unit is powered independently from the outdoor unit). If the E6 code is still displayed the FTC and/or the outdoor unit circuit board should be replaced.
E7	Indoor/outdoor communication failure (Transmission error) Error code E7 is displayed if signal "1" is received 30 consecutive times despite the FTC board sending signal "0".	 Fault with FTC transmission/receiving circuit board Electrical noise causes interference with power supply. Electrical noise causes interference with FTC-outdoor unit transmission cable. 	 to 3. Turn the power to the indoor unit OFF and then ON. Power to both the indoor unit and outdoor units should be switched OFF then ON. (This may require switching 1 or 2 breaker depending if the unit is powered indepen- dently from the outdoor unit). If the E7 code is still displayed the FTC circuit board should be replaced.

rror code	Title and display conditions	Possible Cause	Diagnosis and action
E1/E2	Main remote controller control board failure Error code E1 displayed if main remote control- ler cannot access it's non volatile (non power dependent) memory. Error code E2 is displayed when there is a fault with the main remote controller's internal clock.	 Fault with the main remote controller circuit board 	 Replace main remote controller circuit board.
JO	Indoor unit/wireless receiver communication failure Error code J0 is displayed when the FTC cannot receive data from the wireless receiver for 1 minute.	 Connection fault with wireless receiver- FTC connection Fault with FTC receiving circuit board Fault with wireless receiver's transmission circuit board Electrical noise causes interference with wireless receiver communication cable. 	 Check the connections to the wireless receiver and FTC have not become loose a that the connecting cable is not damaged to 4. Turn the power to the indoor unit OFF and then ON. Power to both the indoor unit and outdoor units should be switched OFF then ON. (This may require switching 1 or 2 breaker depending if the unit is powered independently from the outdoor unit). If the J0 code is still displayed the FTC an or the wireless receiver circuit board shoul be replaced.
J1 to J8	Wireless remote controller/wireless receiver communication failure (Reception error) Error code displayed if wireless receiver receives no/incomplete data from the wireless remote controller for 15 consecutive minutes. The digit after the J refers to the address of the wireless remote controller that has the error. E.g. Error code "J3" refers to a communication fault between the wireless receiver and wireless remote control with address 3.	 Battery on wireless remote control may be flat. The wireless remote controller is out of range of the wireless receiver. Fault with wireless remote controller transmission circuit board Fault with wireless receiver's reception circuit board 	 Check and replace the battery, if necessa the wireless remote controller battery. to 4. Reposition the wireless remote control clos to the receiver and perform a communicative test. For procedure refer to wireless remote controller installation manual. If "OK" is displayed then the cause of the J1 to J8 error was the controller was out of range of the receiver. The wireless remote controller should be installed within range of the receiver. If "Err" is displayed replace wireless remote controller with a new controller and perform the pairing procedure. If after this procedure the "Err" code is still displayed the fault is with the receiver unit (attached to the indoor unit). The receiver unit should be replaced with a new part and the original remote control ca be reconnected. If "OK" is displayed then the fault is with the remote control and this should be replaced
J9	Main remote controller communication failure Error code J9 is displayed when signal is not received normally from FTC (slave) for 3 minutes.	Refer to error	codes (E0 and E4)
J*, F*, A*	Outdoor unit failure	Outdoor unit failure	Refer to outdoor unit service manual.

Note: To cancel error codes, please switch system OFF (press button F4 (RESET) on main remote controller).

10-5. Troubleshooting by infe	erior phenomena
-------------------------------	-----------------

No.	Fault symptom	Possible cause	Explanation - Solution
1	Main remote controller display is blank.	 There is no power supply to main remote controller. Power is supplied to main remote controller, however, the display on the main remote controller does not appear. 	 Check LED2 on FTC. (See "6. WIRING DIAGRAM".) (i) When LED2 is lit. Check for damage or contact failure of the main remote controller wiring. (ii) When LED2 is blinking. Refer to No. 5 below. (iii) When LED2 is not lit. Refer to No. 4 below. Check the following: Disconnection between the main remote controller cable and the FTC control board Failure of the main remote controller if "Please Wait" is not displayed. Refer to No. 2 below if "Please Wait" is displayed.
2	"Please Wait" remains displayed on the main remote controller.	 "Please Wait" is displayed for up to 6 minutes. Communication failure between the main remote controller and FTC Communication failure between FTC and outdoor unit 	 Normal operation 3. Main remote controller start up checks/procedure. (i) If "0%" or "50–99%" is displayed below "Please Wait", there is a communication error between the main remote controller and the FTC control board. Check wiring connections on the main remote controller. Replace the main remote controller or the FTC control board. (ii) If "1–49%" is displayed, there is a communication error between the outdoor unit's and FTC's control boards. Check the wiring connections on the outdoor unit control board and the FTC control board. (Ensure S1 and S2 are not cross-wired and S3 is securely wired with no damage. (See "7. FIELD WIRING".) Replace the outdoor unit's and/or the FTC's control boards.
3	The main screen appears with a press of the "ON" button, but disappears in a second.	The main remote controller operations do not work for a while after the settings are changed in the service menu. This is because the system takes time to apply the changes.	Normal operation The indoor unit is applying updated settings made in the service menu. Normal operation will start shortly.
4	LED2 on FTC is OFF. (See "6. WIRING DIAGRAM".)	 When LED1 on FTC is also OFF. (See "6. WIRING DIAGRAM".) <ftc outdoor="" powered="" unit.="" via=""></ftc> 1. The outdoor unit is not supplied at the rated voltage. 2. Defective outdoor controller circuit board 	 Check the voltage across the terminals L and N or L3 and N on the outdoor power board. (See "7. FIELD WIRING".) When the voltage is not 220 to 240 V AC, check wiring of the outdoor unit and of the breaker. When the voltage is at 220 to 240 V AC, go to "2." below. Check the voltage across the outdoor unit terminals S1 and S2. (See "7. FIELD WIRING".) When the voltage is not 220 to 240 V AC, check the fuse on the outdoor control board and check for faulty wiring.
		3. FTC is not supplied with 220 to240 V AC.	 When the voltage is 220 to 240 V AC, go to "3." below. Check the voltage across the indoor unit terminals S1 and S2. (See "7. FIELD WIRING".) When the voltage is not 220 to 240 V AC, check FTC-outdoor unit wiring for faults. When the voltage is 220 to 240 V AC, go to "4." below.
		4. FTC failure	 4. Check the FTC control board. Check the fuse on FTC control board. Check for faulty wiring. If no problem found with the wiring, the FTC control board is faulty.
		5. Faulty connector wiring	 5. Check the connector wiring. • When the connectors are wired incorrectly, re-wire the connectors referring to below. (See "7. FIELD WIRING".) Initial settings (Power supplied by outdoor unit)

No.	Fault symptom	Possible cause	Explanation - Solution
4	LED2 on FTC is off. (See "6. WIRING DIAGRAM".)	<ftc independent="" on="" powered="" source=""> FTC is not supplied with 220 to 240 V AC. There are problems in the method of connecting the connectors. </ftc>	 Check the voltage across the L and N terminals on the indoor power supply terminal block. (See "7. FIELD WIRING".) When the voltage is not 220 to 240 V AC, check for faulty wiring to power supply. When the voltage is 220 to 240 V AC, go to 2. below. Check for faulty wiring between the connectors. When the connectors are wired incorrectly re-wire them correctly referring to below. (See 7. FIELD WIRING and a wiring diagram on the control and electrical box cover.)
		3. FTC failure When LED1 on FTC is lit.	If no problem found with the wiring, go to 3. below. Check the FTC control board. Check the fuse on FTC control board. Check for faulty wiring. If no problem found with the wiring, the FTC control board is faulty. Recheck the refrigerant address setting on the outdoor unit.
		Incorrect setting of refrigerant address for outdoor unit (None of the refrigerant address is set to "0".)	Set the refrigerant address to "0". (Set refrigerant address using SW1(3–6) on outdoor controller circuit board.)
5	LED2 on FTC is blinking. (See "6. WIRING DIAGRAM".)	When LED1 is also blinking on FTC . Faulty wiring between FTC and outdoor unit When LED1 on FTC is lit.	Check for faulty wiring between FTC and outdoor unit.
		 Faulty wiring in main remote controller Multiple indoor units have been wired to a single outdoor unit. Short-circuited wiring in main remote control- ler Main remote controller failure 	 Check for faulty wiring in main remote controller. The number of indoor units that can be wired to a single outdoor unit is one. Additional indoor units must be wired individually to a single outdoor unit. Remove main remote controller wires and check LED2 on FTC. (See Figure 5.2.1. in installation manual) If LED2 is blinking check for short circuits in the main remote controller wiring. If LED2 is lit, wire the main remote controller again and: if LED2 is blinking, the main remote controller is faulty; if LED2 is lit, faulty wiring of the main remote controller has been corrected.
6	LED4 on FTC is off. (See "6. WIRING DIAGRAM".)	 SD memory card is NOT inserted into the memory card slot with correct orientation. Not an SD standards compliant memory card. 	 Correctly insert SD memory card in place until a click is heard. Use an SD standards compliant memory card. (Refer to "5.9. in installation manual)
	LED4 on FTC is blinking. (See "6. WIRING DIAGRAM".)	 Full of data. Write-protected. NOT formatted. Formatted in NTFS file system. 	 Move or delete data, or replace SD memory card with a new one. Release the write-protect switch. Refer to "5.9 Using SD memory card" in installation manual. FTC is Not compatible with NTFS file system. Use an SD memory card formatted in FAT file system.
7	No water at hot tap.	 Cold main OFF Strainer (local supply) blocked. 	 Check and open stop cock. Isolate water supply and clean strainer.
8	Cold water at tap.	 Hot water run out. Prohibit, schedule timer or holiday mode selected or demand control input (IN4) or smart grid ready (switch-off command). Heat pump not working. Booster heater cut-out tripped. The earth leakage circuit breaker for booster heater breaker (ECB1) tripped. The booster heater thermal cut-out has tripped and cannot be reset using the manual reset button. Immersion heater breaker (ECB2) tripped. 	 Ensure DHW mode is operating and wait for DHW tank to re-heat. Check settings and change as appropriate. Check heat pump – consult outdoor unit service manual. Check booster heater thermostat and press reset button if safe. Reset button is located on the side of booster heater, covered with white rubber cap. See "4. PARTS NAMES AND FUNCTIONS" to find out its position. Check the cause and reset if safe. Check resistance across the thermal cut-out, if open then the connection is broken and the booster heater will have to be replaced. Contact your Mitsubishi Electric dealer. Check immersion heater thermostat and press reset button, located on immersion heater boss, if safe. If the heater has been operated with no water inside it may have failed, so please replace it with a new one. Check the cause and reset if safe.
		9. 3-way valve fault	 Check plumbing/wiring to 3-way valve. (i) Manually override 3-way valve using the main remote controller. (Refer to <manual operation=""> in "9-4. Service menu".) If the valve does not still function, go to (ii) below.</manual> (ii) Replace 3-way valve.

No.	Fault symptom	Possible cause	Explanation - Solution
9	Water heating takes longer.	 Heat pump not working. Booster heater cut-out tripped. 	 Check heat pump – consult outdoor unit service manual. Check booster heater thermostat and press reset button if safe. Reset button is located on the side of booster heater, covered with white rubber cap. See "4. PARTS NAMES AND FUNCTIONS" to find out its position.
		 Booster heater breaker (ECB1) tripped. The booster heater thermal cut-out has tripped and cannot be reset using the manual reset button. Immersion heater cut-out has been triggered. Immersion heater breaker (ECB2) tripped. 	 Check the cause and reset if safe. Check resistance across the thermal cut-out, if open then connection is broken and the booster heater will have to be replaced. Contact your Mitsubishi Electric dealer. Check immersion heater thermostat and press reset button if safe. If the heater kept running with no water inside, this may have resulted in failure, so replace it with a new one. Check the cause and reset if safe.
10	Temperature of DHW tank water dropped.	When DHW operation is not running, the DHW tank emits heat and the water temperature decreases to a certain level. If water in the DHW tank is reheated frequently because of a signifi- cant drop in water temperature, check for the following. 1. Water leakage in the pipes that connect to	1. Take the following measures.
		 viale leakage in the pipes that connect to the DHW tank Insulation material coming loose or off. 	 Retighten the nuts holding the pipes onto the DHW tank. Replace seal materials. Replace the pipes. 2. Fix insulation.
		3. 3-way valve failure	 Check plumbing/wiring to 3-way valve. (i) Manually override 3-way valve using the main remote controller. (Refer to <manual operation=""> in "9-4. Service menu".) If the valve does not still function, go to (ii) below.</manual> (ii) Replace 3-way valve.
11	Hot or warm water from cold tap.	Heat of hot water pipe is transferred to cold water pipe.	Insulate/re-route pipework.
12	Water leakage	1. Poorly sealed connections of water circuit components	1. Tighten connections as required.
		2. Water circuit components reaching the end of life	Refer to PARTS CATALOG in the service manual for expected part lifetimes and replace them as necessary.
13	Heating system does not reach the set temperature.	 Prohibit, schedule timer or holiday mode se- lected or demand control input (IN4) or smart grid ready (switch-off command). 	1. Check settings and change as appropriate.
		2. Check settings and change as appropriate.	2. Check the battery power and replace if flat.
		 The temperature sensor is located in a room that has a different temperature relative to that of the rest of the house. 	3. Relocate the temperature sensor to a more suitable room.
		4. Heat pump not working.	 Check heat pump – consult outdoor unit service manual.
		5. Booster heater cut-out tripped.	 Check booster heater thermostat and press reset button if safe. Reset button is located on the side of booster heater, covered with white rub- ber cap. (See "4. PARTS NAMES AND FUNCTIONS" for position.)
		6. Booster heater breaker (ECB1) tripped.	6. Check the cause of the trip and reset if safe.
		 The booster heater thermal cut-out tripped and cannot be reset using the manual reset button. 	 Check resistance across the thermal cut-out, if open then the connection is bro- ken and the booster heater will have to be replaced. Contact your Mitsubishi Electric dealer.
		8. Incorrectly sized heat emitter.	 Check the heat emitter surface area is adequate Increase size if necessary.
		9. 3-way valve failure	9. Check plumbing/wiring to 3-way valve.
		10. Battery problem (*wireless control only)	10. Check the battery power and replace if flat.
		 If a mixing tank is installed, the flow rate between the mixing tank and the hydrobox is less than that between the mixing tank and the local system. 	 Increase the flow rate between the mixing tank and the hydrobox decrease that between the mixing tank and the local system.

No.	Fault symptom	Possible cause	Explanation - Solution	
14	In 2-zone tempera- ture control, only Zone2 does not	 When Zone1 and Zone2 are both in heating mode, the hot water temperature in Zone2 does not exceed that in Zone1. 	1. Normal action No action necessary	
	reach the set tem- perature.	 Faulty wiring of motorized mixing valve Faulty installation of protocized mixing valve 	 Refer to "5.3 Wiring for 2-zone temperature control" in installation manual. Charle for control installation (Defer to the manual installation manual). 	
		 Faulty installation of motorized mixing valve Incorrect setting of Running time 	 Check for correct installation. (Refer to the manual included with each mo- torized mixing valve.) Check for correct setting of Running time. 	
		 Incorrect setting of Running time Motorized mixing valve failure 	 Check for context setting of Running time. Inspect the mixing valve. (Refer to the manual included with each motorized 	
15	After DHW operation	At the end of the DHW mode operation the 3-way	 More a control of the manual included with each motorized mixing valve.) Normal operation 	
15	room temperature rises slightly.	valve diverts hot water away from the DHW circuit into space heating circuit. This is done to prevent the hydrobox components from overheating. The amount of hot water directed into the space heating circuit varies according to the type of the system and of the pipe run between the plate heat exchanger and the hydrobox.	No action necessary	
16	The room tempera- ture rises during DHW operation.	3-way valve failure	Check the 3-way valve.	
17	Water discharges from pressure relief valve.	 If continual – pressure relief valve may be damaged. 	 Turn the handle on the pressure relief valve to check for foreign objects in it. If the problem is not still solved, replace the pressure relief valve with a new one. 	
	(Primary circuit)	 If intermittent – expansion vessel charge may have reduced/bladder perished. 	 Check pressure in expansion vessel. Recharge to 1 bar if necessary. If bladder perished replace expansion vessel with a new one. 	
18	Water discharges from pressure relief	 If continual – field supplied pressure reducing valve not working. 	 Check function of pressure reducing valve and replace if necessary. 	
	valve (field supplied item). (Sanitary circuit)	 If continual – pressure relief valve seat may be damaged. 	Turn the handle on the pressure relief valve to check for foreign objects inside. If the problem is not still solved, replace the pressure relief valve.	
		 If intermittent – expansion vessel charge may have reduced/bladder perished. 	 Check gas-side pressure in expansion vessel. Recharge to correct precharge pressure if necessary. If bladder perished replace expansion vessel with a new one with appropriate pre-charge. 	
		 DHW tank may have subjected to backflow. 	4. Check the pressure in DHW tank. If pressure in DHW tank is similar to that in the incoming mains, cold water supply that merges with incoming mains wa- ter supply could flow back to DHW tank. Investigate source of back-feed and rectify error in pipework/fitting configuration. Adjust pressure in cold supply.	
19	Noisy water circula- tion pump	Air in water circulation pump	Use manual and automatic air vents to remove air from system. Top up water if necessary to achieve 1 bar on primary circuit.

Consumed electric energy Delivered heat energy SW3-4 Electric energy meter (Local supply) OFF Without ON With (2) In the case external electric energy meter and/or heat meter is not used, check if the setting for electric heater and water pump(s) input is correct by referring to <energy monitor="" setting=""> in "9-4. Service Menu". (3) In the case external electric energy meter and/or heat meter is used, check if the unit of output pulse on external meter matches with the one set at the main remote controller by referring to <energy monitor="" setting=""> in "9-4. Service Menu". 2. Check if the external meter (local supply) is connectable type by referring to <energy monitor="" setting="">" in "9-4. Service Menu". 3. Check if signal is sent to IN8 to IN10 properly. (Refer to "6. WIRING DIAGRAM") Replace the external heat meter if defective. 4. Check the FTC control board. • Check for faulty wiring. • If no problem found with the wiring, the FTC control board is faulty. Replace the</energy></energy></energy>	
31	Heat pump is forced to turn ON and OFF.	Smart grid ready input (IN11 and IN12) is used, and switch-on and off commands are input.	board. Normal operation no action necessary.	

Annual Maintenance

It is essential that the hydrobox is serviced at least once a year by a qualified individual any spare parts required MUST be purchased from Mitsubishi Electric (safety matter).

NEVER bypass safety devices or operate the unit without them being fully operational.

<Draining the hydrobox>

WARNING: DRAINED WATER MAY BE VERY HOT

- 1. Before attempting to drain the hydrobox isolate from the electrical supply to prevent booster heater burning out.
- 2. Isolate hydrobox from primary water circuit and drain water from hydrobox. Use a suitable heat resistant hose to assist in these operations.
- 3. Drain any remaining water from booster heater using fitted drain cock and hose to safely drain the unit.
- 4. After the hydrobox is drained, water remains in the following component parts. Drain water completely by checking the inside of the parts.
- Strainer (Remove the strainer cover.)
- Pressure relief valve (Operate the valve.)

<Annual maintenance points>

Use the Annual Maintenance Log Book (in 13-2.) as a guide to carrying out the necessary checks on the hydrobox and outdoor unit.

<Preparation for the repair service>

- Prepare the proper tools.
- Prepare the proper protectors.
- Provide adequate ventilation.
- After stopping the operation of the hydrobox and outdoor unit, turn off all the power-supply breaker.
- Discharge the condenser before the work involving the electric parts.
- Allow parts to cool.
- Do not expose the electric parts to water.
- When replacing or servicing water circuit parts, drain system first.

Check individual illustrations and positions of the parts by referring to the parts catalog.

Some lead wires and pipes are bundled with Bands. Cut the bands to undo the fastened pipes and lead wires if necessary. When bundling the lead wires and pipes again, use new commercially available bands.

When removing the parts associated with water pipe work, drain the hydrobox as necessary. (Refer to "Draining the Hydrobox" on page 23.)

When draining the hydrobox, keep water from splashing on the internal parts (mainly electric parts and insulations).

4. How to swing the control box to the front

- (1) Remove the front panel. (Refer to Procedure 1.)
- (2) Remove the screw from the control box bracket (R) and 2 screws from the control box bracket (L). (Photo 4-1)
- (3) Disengage the control box bracket (R) from the right-hand side panel and pull the control box. At this point, lifting slightly and pulling the control box will swing the control box to the front. (Photo 4-2)
- (4) Release the coated clamp. (Photo 4-2)

Note: Remove the field wiring as necessary.

Note: The photos shown are of the E*SE-YM9EC model.

Photo 4-2

5. How to remove water pump/pump valve

<Water pump>

- Close the pump valve and the strainer valve (OFF) before removing the water pump, and open the valves (ON) after reinstalling the water pump. (Photo 5-2)
- (1) Remove the front panel. (Refer to Procedure 1.)
- (2) Disconnect the CNP1 connector, the earth cable, and the CNPWM connector in the control box. (Photo 5-1)
- (3) Release the water pump lead wire from the 5 cable clamps, the 2 cable straps, the coated clamp and feed the lead wire out the control box without putting strain on the CNP1 connector. (Photo 5-1)
- (4) Swing the control box to the front. (Refer to Procedure 4.)
- (5) Close (OFF) the pump valve and the strainer valve, and remove the G1-1/2" nuts using 2 wrenches: one to hold the pump and the other to turn the individual nut. Remove the water pump by sliding it horizontally. (Photo 5-2)
 - When reinstalling the G1-1/2" nuts, use a new G1-1/2" gaskets. (Photo 5-3)
 - Set the water pump in the way that the die stamped arrow facing down, and the terminal box facing to the left. (Photo 5-2)
 - · When opening or closing the pump valve, ensure to do so fully, not halfway.

<Pump valve>

- (6) Remove the screws fixing the pump valve stay. (Photo 5-2)
- (7) Remove the pump valve by detaching the different diameter quick connection. (Photo 5-2)
 - When reinstalling the different diameter quick connection, use a new O-ring.
 - When reinstalling the pump valve, place the handle to the left hand side of the pump valve.
 - When opening or closing the pump valve, ensure to do so fully, not halfway.
 - Reuse the removed pump valve stay and the pump valve stay fixing screws. (Photo 5-4)
 - Refer to page 73 for how to attach and detach the different diameter quick connection.
 - Note: Skip Steps (2) and (3) above when replacing the pump valves only.

Strainer valve

6. How to remove the flow sensor

- (1) Remove the front panel. (Refer to Procedure 1.)
- (2) Disconnect the CN1A connector on the controller board. (Photo 6-1)
- (3) Release the flow sensor lead wire from the cable clamp, the 2 cable straps and feed the lead wire out the control box without putting strain on the CN1A connector. (Photo 6-1)
- (4) Swing the control box to the front. (Refer to Procedure 4.)
- (5) Remove the elbow joint by detaching the different diameter quick connection. (Photo 6-2)
 - Refer to page 73 for how to attach and detach the different diameter quick connection.
- (6) Remove the flow sensor by detaching the same diameter quick connection. (Photo 6-3)
 - When reinstalling the same diameter quick connection, use a new O-ring. (Photo 6-4)
 - Apply grease on the O-ring using a plastic bag, etc. (Refer to Photo 14-4 on page 73.)
 - Set the flow sensor in the orientation of the arrow printed on the flow sensor and in the way that the sensor part faces to the front. (Photo 6-3)

PHOTOS Photo 6-1 CN1A connector 9.9 ead wire Cable clamp Cable strap

Photo 6-2

O-ring

quick connection

7. How to remove the booster heater

(1) Remove the front panel. (Refer to Procedure 1.)

- (2) Disconnect the booster heater lead wires from the CNBH and CNBHT connector on the controller board and from the BHC1 (Lead wire No.1, No.2 and No.3) and BHC2 (Lead wire No.4, No.5 and No.6) contactors respectively. (Photo 7-1)
- (3) Swing the control box to the front. (Refer to Procedure 4.) Note: Do not mix up the lead wire numbers when

re-connecting the lead wires to the contactors as the lead wire numbers are different dependent on the models.

Model	Lead wire No.	Contactor
EHSE-YM9EC	No.1	BHC1-U
ERSE-YM9EC	No.2	BHC1-V
	No.3	BHC1-W
	No.4	BHC2-U
	No.5	BHC2-V
	No.6	BHC2-W

Refer to "6. WIRING DIAGRAM".

- (4) Remove the pump valve. (Refer to Procedure 5.)
- (5) Remove the flow sensor. (Refer to Procedure 6.)
- (6) Remove the elbow joint and the pipe (BH-FS.) by detaching the different diameter quick connection. (Photo 7-2)
 - When reinstalling the different diameter quick connection, use a new O-ring.
 - Refer to page 73 for how to attach and detach the different diameter quick connection.
- (7) Remove the flare nut (Photo 7-2).
- (8) Remove the 2 screws that hold the heater stay onto the back panel. Lift the booster heater slightly and remove the booster heater with the heater stay from the back panel. (Photo 7-2 and 7-3)
- (9) Remove the 2 screws on the back of the heater stay and remove the heater stay from the booster heater. (Photo 7-3)
 - Reuse the removed heater stay and the heater stay fixing screws.

Photo 7-3

Note: The photos shown are of the E*SE-YM9EC model.

Photo 7-2

OCH590C

8. How to remove the strainer valve

<Removal of the strainer cover (debris recovery)>

- (1) Remove the cover with 2 wrenches: one to hold the strainer valve and the other to turn the cover. (Photo 8-1)
 - Be sure to reattach the mesh after washing. (Photo 8-3)
 - When reinstalling the cover, use a new o-ring.

<Removal of the strainer valve body>

- (2) Remove the front panel. (Refer to Procedure 1.)
- (3) Swing the control box to the front. (Refer to Procedure 4.)
- (4) Close the strainer valve (OFF). (Photo 8-1)
 - When opening or closing the strainer valve, ensure to do so fully, not halfway.
- (5) Lift up the plate heat exchanger. (Refer to Procedure 9 (1) to (14))
 - When reinstalling the different diameter quick connections, use a new O-rings.
 - Refer to page 73 for how to attach and detach the different diameter quick connection.
 - Apply grease on the O-ring using a plastic bag, etc. (Refer to Photo 14-4 on page 73.)
 - Reuse the removed strainer valve stay and the strainer valve stay fixing screws. (Photo 8-2)
- (6) Remove the strainer valve body.

9. How to remove the plate heat exchanger (continued)

- When reinstalling the different diameter quick connection, use a new O-ring.
- Refer to page 73 for how to attach and detach the different diameter quick connection.
- (5) Remove the TH2 thermistor from the thermistor holder. (Photo 9-3)
- (6) Remove the flare nuts on the gas and liquid pipes under the hydrobox using 2 wrenches: one to hold each flare joint and the other to turn each flare nut.
- (7) Remove the water coil cover by removing the 6 screws. (Photo 9-2)
- (8) Remove the 2 screws on the strainer valve stay.(Photo 9-3)
- (9) Detach the same diameter quick connection. (Photo 9-3)
- (10) Lift up the plate heat exchanger and remove the strainer valve by detaching the different diameter guick connection. (Photo 9-4)
 - When reinstalling the same and different diameter quick connections, use a new O-ring.
 - Apply grease on the O-ring using a plastic bag, etc. (Refer to Photo 14-4 on page 73)
- (11) Pull out the plate heat exchanger assembly from the hydrobox by lifting it upward. (Photo 9-5)

DISASSEMBLY PROCEDURE	PHOTO	OS
 0. How to remove the manometer/pressure relief valve/air vent (automatic) (Continued) <air (automatic)="" vent=""></air> (1) Remove the air vent with a flare joint using 2 wrenches: one to hold the flare joint and the other to turn the flare nut. (2) Remove the flare joint from the air vent. (Photo 10-6) 	Photo 10-5	Air vent Flare joint Flare nut
 1. How to remove the drain cock (primary circuit) (1) Remove the front panel. (Refer to Procedure 1.) (2) Swing the control box to the front. (Refer to Procedure 4.) (3) Remove the drain cock (primary circuit). (Photo 11-1) 	Photo 11-1	Booster heater

Notes on replacing the parts

Replacement of the parts listed below requires the following procedure.

After the parts are removed, eliminate loctite on threads by applying loctite remover, apply new loctite, and then install and tighten the parts to the specified tightening torques below. For details about recommended loctite and loctite remover, refer to Table 11-1, and for details about the replacement parts and their tightening torques, refer to Table 11-2.

Table 11-1

Recommended	Manufacturer	No.	Note
Loctite	Henkel	Loctite 577	Apply loctite all over from the end of external thread to the second ridge. After installing the parts, fix the parts for at least 30 minutes
Loctite remover	Henkel	Loctite 7200 Gasket Remover	Spray loctite remover over sealant on the threads, let the sealant sit until soft, and then eliminate it with a wire brush.

Note: When using the products above, refer to the appropriate manuals that come with the individual products.

Table 11-2

Part name *'	Recommended tightening torque [Nm] * ²
PRESSURE RELIEF VALVE 3bar	15 ± 1

*¹ For more details about the listed parts, refer to the parts catalogue.

*2 Undertightening and overtightening the parts affect water seal life. Tighten the parts to the appropriate tightening torques.

When installing the parts that are not listed above, observe the tightening torques in accordance with Table 11–3. Always use a new O-ring or gasket. Table 11-3

Size [inch]		Recommended tightening torque [Nm]
Caskat	G1/4"	8 ± 1
Gasket	G1 1/2"	42 ± 2
O ring	Strainer cover	45 ± 2
O-ring	Air vent (Automatic)	15 ± 1
Attached packing	Drain cock (primary circuit)	0.25 ± 0.05
Flare joint	Booster heater	35 ± 2

After the procedure is complete, ensure that no water leaks.

SUPPLEMENTARY INFORMATION

12-1. Refrigerant collecting (pumpdown) for split model systems only

Refer to "Refrigerant collection" in the outdoor unit installation manual or service manual.

12-2. Back-up operation of boiler

Heating operation is backed up by boiler. For more details, refer to the installation manual of PAC-TH011HT-E.

<Installation & System set up>

12

1. Set DIP-SW 1-1 to ON "With boiler" and SW2-6 to ON "With Mixing tank".

- 2. Install the thermistors THWB1 (Flow temp.) and THWB2 (Return temp.) (*1) on the boiler circuit.
- 3. Connect the output wire (OUT10: Boiler operation) to the signal input (room thermostat input) on the boiler. *2
- 4. Install one of the following room temp. thermostats. *3
 - · Wireless remote controller (option)
 - Room temp. thermostat (local supply)
 - · Main remote controller (remote position)
- *¹ The boiler temperature thermistor is an optional part.
- *² OUT10 has no voltage across it.
- *3 Boiler heating is controlled ON/OFF by the room temp. thermostat.

<Remote controller settings>

- 1. Go to Service menu > Heat source setting and choose "Boiler" or "Hybrid". *4
- 2. Go to Service menu > Operation settings > Boiler settings to make detailed settings for "Hybrid" above .

*⁴ The "Hybrid" automatically switches heat sources between Heat pump (and Electric heater) and boiler.

12-3. Multiple outdoor units control

To realize bigger systems by using multiple outdoor units, up to 6 units of the same model can be connected. The hydrobox can be used as a slave unit for multiple outdoor unit control. For more details, refer to the installation manual of PAC-IF061/062B-E. PAC-IF051/052B-E cannot be connected to the hydrobox. Check the model name of connecting master unit.

<DIP switch setting>

- · Set DIP SW4-1 to ON "Active: multiple outdoor unit control".
- Keep DIP SW4-2 OFF (default setting) (master/slave setting: slave).
- Set DIP SW1-3 to ON when the hydrobox is connected to a DHW tank.

The main remote controller settings changed from the default settings are reset by replacing the controller board. To facilitate reselecting settings on the main remote controller, it is recommended to write down the changes in the sheet below before replacement.

13-1. Engineers Forms

Should settings be changed from default, please enter and record new setting in 'Field Setting' column. This will ease resetting in the future should the system use change or the circuit board need to be replaced.

*1 The settings related to Zone2 can be switched only when 2 Zone temperature control is enabled (when DIP SW2-6 and SW 2-7 are ON).

*2 For the model without both booster and immersion heater, it may not reach the set temperature depending on the outside ambient temperature.

 *3 The lower limit is –15°C depending on the connected outdoor unit.

*4 The lower limit is -13° C depending on the connected outdoor unit.

 *5 The lower limit is $-14^{\circ}C$ depending on the connected outdoor unit.

2	Check rating and fuse fitted on the el	ectricity supply.			
	Controller		Frequency	Notes	
1	Check field settings against factory re	ecommendations.			
2	Check battery power of wireless ther	mostat and replace if necessary.			
Outdoor	heat pump unit maintenance record s	heet			
Model n	Model number		Serial number		
	Mechanical		Frequency	Notes	
1	Inspect grill, heat exchanger fins and	air inlet for trapped debris/damage.			
2	Check condensate drain provision.				
3	Check integrity of water pipe work an	d insulation.			
4	Check all electrical connections.				
5	Check and record the operation volta	an			

All the above checks should be carried out once a year.

Notes:

1. Within the first couple of months of installation, remove and clean the hydrobox's strainer mesh plus any that are fitted external to the hydrobox. This is especially important when installing on an existing system.

2. Check valves open completely after servicing and maintenance.

In addition to annual servicing, it is necessary to replace or inspect some parts after a certain period of system operation. Please see tables below for detailed instructions. Replacement and inspection of parts should always be done by a competent person with relevant training and qualifications.

Parts which require regular replacement

Parts	Replace every	Possible failures
Pressure relief valve (PRV) Air vent (Auto/Manual) Drain cock (Primary circuit) Manometer	6 years	Water leakage

Parts which require regular inspection

Parts	Check every	Possible failures
Water circulation pump	20,000 hrs (2 years)	Water circulation pump
water circulation pump	20,000 ms (3 years)	failure

Parts which must NOT be reused when servicing

O-ring

Gasket

Note:

Always replace the gasket for pump with a new one at each regular maintenance (every 20,000 hours of use or every 3 years).
